OTHER TRIVIA

- Q: Why did telephone companies give up those old-timey phone booths with seats and doors for the new open-air stand-up models?

A: Cost. Too many thieves, vandals and weirdos tore up the coin boxes, broke out the glass and committed indecencies therein, making the booths impossible to clean and expensive to replace.

- Engineers claim a waterbed with its weight spread evenly over a larger area is not as stressful to a floor as a refrigerator. Besides, that humming refrigerator vibrates more, possibly.
- A bouncing glass ball, if it doesn't break, will bounce higher than a bouncing rubber ball.
- Q: What did the first skywriter use to make smoke?

A: Paraffin in light oil. Major John Savage of England was the man. In 1922. He piped the mix through the plane's engine exhaust.
